To make it easier to work with Photoshop layers and to keep your creations organized, here are a few tools that should be on your toolbox: Folders: The Create Templates System found in the Layers palette (refer to Chapter 1) creates a template to quickly place a new image in Photoshop and then place it in a specific folder. Hidden Layers: As you work, you can create layers that are hidden and aren't displayed by default when you make your canvas full size. Hidden layers are very useful for saving work and holding multiple versions of an image. Layer Groups: You can create a group (refer to Chapter 1) to save your layers and create them as a group. Although this is usually done by choosing File → Save As or File → Create a Copy, you can right-click on the canvas and select Layer→ Layer→ New Group from the shortcut menu. After the canvas is changed to this layer group, you can remove the layer group from the canvas simply by deleting the group from the Layers palette. Then, if you need to place a different layer in the group to save it, you simply move the group from the Layers palette to the main canvas. Object-level Selections: When you create a layer in Photoshop, the default setting is to use object selections to add objects to the layer. However, if you want to make a layer more general, you can select layers to delete all object selections and use only the object-level selection tool. Navigating Layers: The Layers palette enables you to see all the layers in the main canvas. You can use the up and down arrow keys to access layers and pages of layers, and you can use the Show/Hide Controls button to toggle layers on or off. Figure 2-1 is a very simple 8½-by-11-inch artwork I did in Photoshop. It started as a small piece of my own art. I used a Photoshop brush preset to draw the strokes. I then used a Gradient Fill to darken the background and added some text. Whether you're a hobbyist or a professional, it's always a good idea to make sure you have a good graphics editor. Photoshop, Lightroom, and Corel PIX are popular tools used by pros and hobbyists alike. One of the popular tools in the pro-photography industry is Photoshop and Lightroom. These tools are helpful in transforming photographs into big files that look good in print and on social media. There are a lot of people who run into problems with Lightroom when they try to use it to edit their photos. Some of the common problems include slow performance, hang ups, and bugs. One of the most common complaints regarding Lightroom is a slow performance. This slowdown can be caused by RAM issues, crashes, or bugs. In this article, we'll walk you through the steps on how to fix common memory problems in Lightroom. Video: What is Lightroom? Video: Memory Remapping with Linux Remapping the graphic memory of your computer can help to speed up

the performance of Lightroom. Memory remapping is a Linux term that refers to re-mapping a device or part of your hard drive so that programs use it as if it were their own, causing them to run faster. It works like this: Let's say you have 2GB of RAM. Normally, programs are forced to use the first 3GB of RAM as their own. Programs use memory in the order they were installed. When it comes to programs installed in Linux, programs that are installed after the reboot, or after an update, can use as much RAM as the program before it. In other words, the OS tells applications to use as much RAM as they're allowed to. For instance, a program installed late can use as much RAM as the program that was installed before it. Why would this be useful? The first program to be installed is much less likely to run out of RAM than a program installed later. When you allocate more RAM to programs, they'll have more available for use. Programs that have more free RAM to use run faster, and programs with less RAM are forced to start slow. This means that programs on a slower computer are forced to start up slower than they would on a faster computer. This is a good thing. When programs start fast, you can get your work done. How to Re-Map Graphic Memory You can do this manually on Linux systems. The first thing a681f4349e

Q: Is it possible to define a custom SVG font in CSS? I'm trying to create a custom SVG font, and I'm assuming I'll have to write this as a font declaration in my CSS. The only problem is, to get a custom font to display in CSS, it doesn't need to be an SVG font, I can use a .ttf file. Is it possible to create an SVG font which works in CSS? Does anyone know of any web resources that cover this? The properties of the SVG font in the example below are likely wrong, but what I'd like to know is: is it even possible? `@font-face { font-family: 'test_font'; src: url('/path/to/font.svg') } body { font-family: test_font; } A: CSS font support is limited because IE doesn't support it fully. See this article for additional details. The general rule of thumb in CSS is that SVG will be rendered in IE, older versions of Firefox, Chrome, and Opera using document.execCommand("Save") but not document.execCommand("Print"). However, if you don't mind exporting the SVG to a .ttf file, you can do something like this: body { font-family: TestFont; } @font-face { font-family: 'TestFont'; src: url('/path/to/font.ttf') } However, there is no way to embed CSS or embed a precompiled .ttf in a block. Q: Notifications re-appear after Dismiss them iOS I added Notifications to an iOS application a few days ago. I was testing it and noticed that the notifications just keep on popping up again and again. (I didn't even change the code of sending the notifications.) I tried on my iPhone and iPad. Is there something wrong? A: I got the problem solved. It seems that the notifications were appearing multiple times by some weird reason. The next six to eight years will be critical in determining whether the new issue development within the joint with China will be good for the US or`
